② The only DNA polymerase with 5' → 3' exonuclease activity in prokaryotes is:

(a) DNA pol I

(b) DNA pol II

(c) DNA pol III

(d) DNA pol IV

gf removed → Klenow fragment

DNA synthesis in 5' - 3'
5 - 5' - 3'

most processive

1

DNA polymerase III

Prokaryotes only. Elongates leading strand by adding deoxynucleotides to the 3' end. Elongates lagging strand until it reaches primer of preceding fragment.

DNA polymerase III has 5' → 3' synthesis and proofreads with 3' → 5' exonuclease.
Drugs blocking DNA replication often have a modified 3' OH, thereby preventing addition of the next nucleotide ("chain termination").

DNA polymerase I

Prokaryotes only. Degrades RNA primer; replaces it with DNA.

Same functions as DNA polymerase III, also excises RNA primer with 5' → 3' exonuclease.

③ Substrate level phosphorylation occurs in which of the following steps of the TCA cycle?

(a) Isocitrate to alpha keto glutarate

(b) Alpha keto glutarate to succinyl CoA

✓ (c) Succinyl CoA to Succinate

③ - ③ - ③
subst level phosph.
GTP

(d) Succinate to fumarate

1 TCA cycle →

*1 glucose
↓
20 ATP*

Also called Krebs cycle. Pyruvate → acetyl-CoA produces 1 NADH, 1 CO₂.

The TCA cycle produces 3 NADH, 1 FADH₂, 2 CO₂, 1 GTP per acetyl-CoA = 10 ATP/ acetyl-CoA (2× everything per glucose). TCA cycle reactions occur in the mitochondria.

alpha-ketoglutarate dehydrogenase complex requires the same cofactors as the pyruvate dehydrogenase complex (vitamins B₁, B₂, B₃, B₅, lipoic acid).

1, 2, 3, 5,
lipoic

Citrate is Krebs' starting substrate for making oxaloacetate.

Anatomy

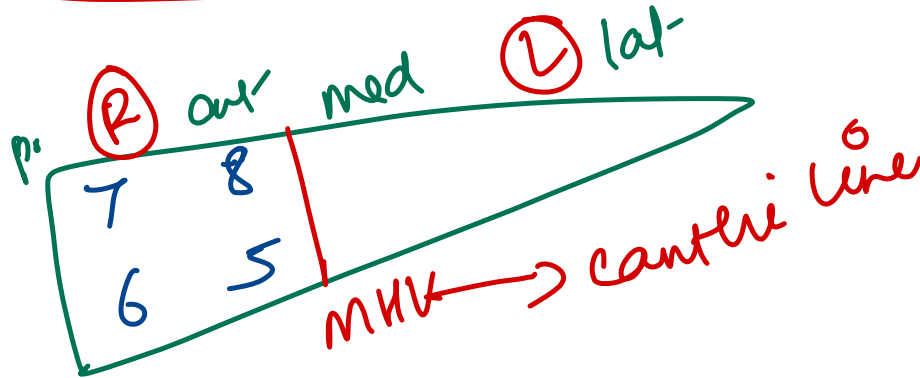

④ Which of the following statements is true with reference to the Couinaud's liver segments?

(a) It is classified based on the distribution of hepatic arteries in the parenchyma

(b) The left lobe of the liver includes segments I, II, and III

(c) Segment IV corresponds to the caudate lobe of the liver

(d) The right lobe of the liver includes segments V, VI, VII, and VIII

Rt ant- → 8, 5
Rt post- → 6, 7

(a) Hyperventilation

(b) Deep and slow breathing → *PRR*
ADD
vagus intact

(c) Apneustic breathing → *C* *vagus cut*

(d) Rapid and shallow breathing

Effects of Transections on Breathing Patterns

⑧ When an ion on one side of a membrane cannot diffuse through the membrane, the distribution of other ions to which the membrane is permeable is affected in a predictable way. This is given by

(a) Gibbs Donnan equation →

(b) Nernst equation → *equil. potential.*

(c) Goldmann equation

(d) Henderson equation → *pH*

The Gibbs–Donnan effect describes the behavior of charged particles near a semipermeable membrane. The Nernst equation describes the electrochemical equilibrium in terms of the reversal potential.

① **Dicrotic notch is** caused by _____

(a) Closing of mitral valva

~~(b)~~ **Closing of aortic valva**

(c) Opening of mitral valva

(d) Opening of aortic valva

∴ absent in AR
aortic v not closing.

The dicrotic notch is a prominent and distinctive feature of the pressure waveform in the central arteries. It is universally used to demarcate the end of systole and the beginning of diastole in these arteries.

10 Which of the following metabolic reaction is not carried by non-microsomal enzymes?

↑ water solubility → excreted.

(a) Glycine conjugation

~~(b) Glucuronide conjugation~~ → ph¹¹ → which is microsomal.

(c) Sulfate conjugation

(d) Acetylation

• Cyp450 → ph[Ⓛ]
FMNO ←

Metabolism: Two Main Phases

Metabolism

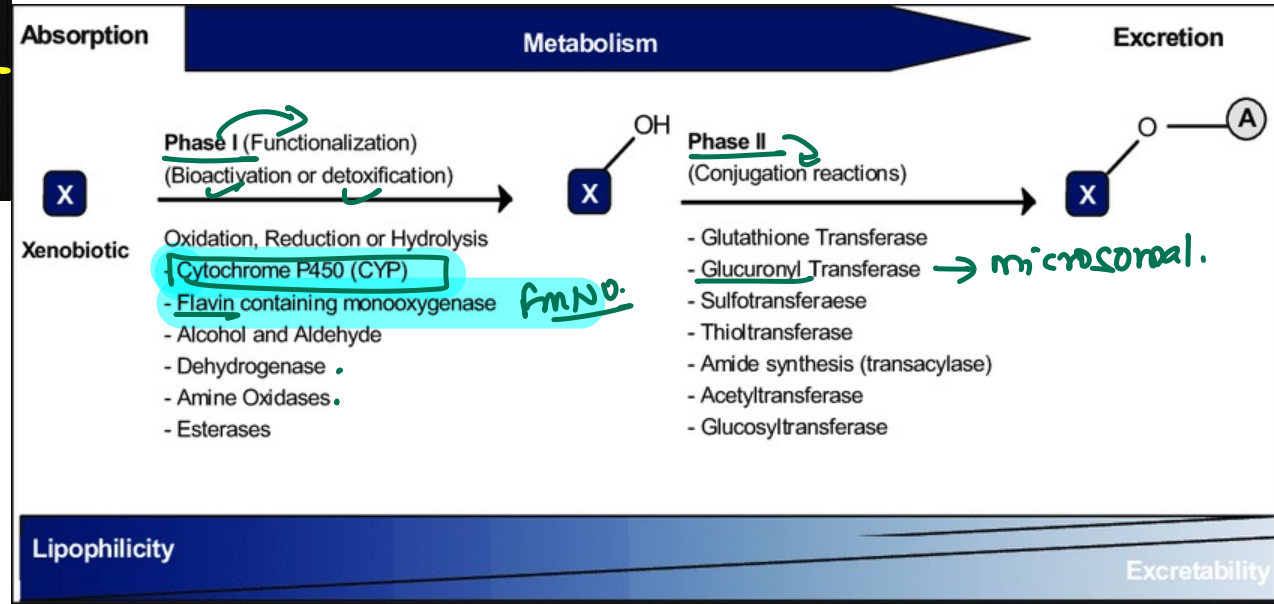

Phase 1

Phase 2

- Generally, involves introduction of **polar** functions (OH, Amine groups)
- Generally, an increase in water solubility.
- **Reactions:** oxidation, reduction, hydrolysis

- Generally involves **conjugation** of preexisting functionality (conjugate drugs with certain attachments or groups)
- Further enhances **water solubility**
- **Reactions:** Conjugations with sulfate, glucuronic acid, amino acids, glutathiones, acyl/methyl groups

27

(ii) The most appropriate description of vasomotor reversal of Dale is

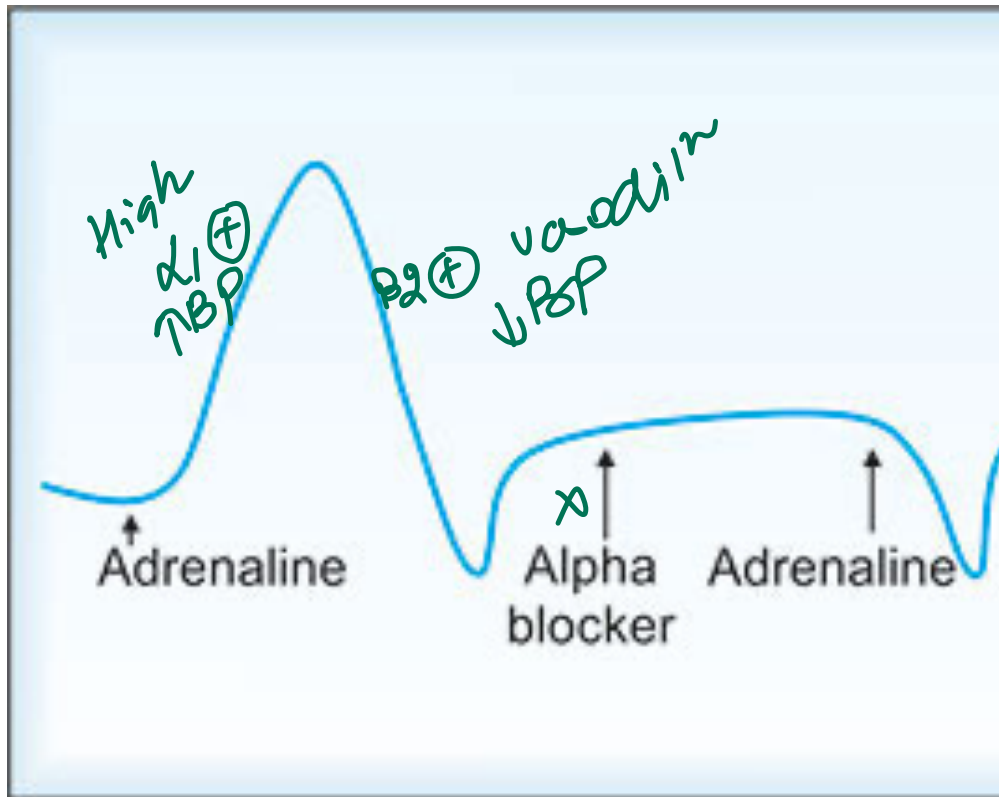

(a) Stimulation of alpha1 followed by stimulation of beta 2

(b) Block of alpha1 followed by stimulation of beta 2

(c) Stimulation of alpha1 followed by block of beta 2

(d) Stimulation of beta1 followed by block of beta 2

13 Which of the following has no anti-factor IIa activity?

(a) Unfractionated heparin

(b) Enoxaparin

~~(c)~~ Fondaparinux → unique to f.x ⊖

(d) Dalteparin

_____ pentasa ce.

parin → parenteral

Parenteral anticoagulants used in acute care medicine

	<u>Unfractionated Heparin (UFH)</u>	<u>Low molecular weight heparin</u>	<u>Fondaparinux</u>	<u>Argatroban</u>	<u>Bivalirudin</u>
Source	Biological	Biological	Synthetic <i>knicks</i>	Synthetic	Synthetic <i>Direct thrombin</i>
Molecular weight	~15,000 Heterogeneous mixture	~5,000 Heterogeneous mixture	1,727	508	2,180
Biological targets	<u>Factor Xa & IIa (thrombin)</u> Some anti-platelet effect	<u>Factor Xa >> Factor IIa</u> (~4:1 to 2:1 ratio)	<u>Factor Xa</u>	Direct thrombin inhibitor (reversible)	Direct thrombin inhibitor (reversible)
Half-life	~1 hour (may increase at higher doses)	~3-6 hours with normal renal function	17-21 hours with normal renal function	45 minutes (~180 min hepatic dysfunx)	25 minutes
Metabolism/excretion	Reticuloendothelial voodoo	~10-40% Renal	Renal	Hepatic metabolism	~80% serum proteases ~20% excreted by kidneys
Use in renal failure	<u>Fine for renal failure</u>	Contraindicated if GFR <30	Contraindicated if GFR <30	Fine for renal failure (no dose adjustment)	OK, but need dose reduction & careful titration
Monitoring	<i>Hapti</i> <u>Anti-Xa level (optimally)</u> <u>PTT (less optimal)</u>	Anti-Xa level 4 hrs post dose	Anti-Xa level 4 hrs post dose	PTT level	PTT level
Antidote?	Protamine Highly effective	<u>Protamine;</u> <u>Partially effective</u>	<u>No antidote</u> Long half-life 😊	No antidote (short half-life)	No antidote (very short half-life)
Risk of HIT	<u>Highest risk (absolute risk usually low; depends on dose & clinical context).</u>	Considerably lower than unfractionated heparin.	No risk ↓	No risk	No risk
Typical role in ICU	Workhorse anticoagulant (especially in patients with renal insufficiency or need for procedures).	Good for patients with adequate renal function, no anticipated procedures & adequate dermal blood perfusion.	Low dose (2.5 mg QD) excellent for prophylaxis and/or acute coronary syndrome. Long half-life makes therapeutic anticoagulation awkward.	<u>Treatment of HIT.</u> - Treatment of heparin resistance.	<u>Treatment of HIT.</u> - Anticoagulation for ECMO, cardiothoracic surgery.

Pathology

14

4-year-old male child presents with fever and fatigue of 2 months duration. On examination, he has generalized lymphadenopathy, splenomegaly, hepatomegaly, and testicular enlargement. Lab investigations show LDH-644mg/dl, TLC - 41900/ mm³, Hb -9.7g/dl and Plt-104000/uL. Marrow is hypercellular and aspirate is as shown below. The cells are myeloperoxidase negative and often contain periodic acid-Schiff-positive cytoplasmic material. All the following are favourable prognostic markers for the condition except:

- (a) Low white cell count ✓
- (b) Hyperdiploidy ✓
- (c) Age less than 2 years - unfav (extremes)
- (d) Presence of a t(12-21) ✓

(b) Stomach

(c) Liver

(d) Heart

first-
↓
lungs

↓
Stomach

HYDROSTATIC TEST

- It is Breslau's first life test, to determine whether the lung has respired or not, by immersing the lung or pieces of lung and check the flotation
- Each lung separated and placed in water
- INFERENCE: **Floats - Respiration occurred**

Sinks - No respiration

abs't air

- Fallacies- **Lungs Sinks: Pneumonia, Atelectasis**
- **Lungs float: Putrefaction**

False

↳ gas ⊕

middle ear → Wredin
weber

STOMACH BOWEL TEST (BRESLAU'S SECOND LIFE TEST)

- Test is done to determine whether the child was born alive or not.

Principle

- Some air is swallowed during respiration in a live born child and detecting the presence of this air in these viscera constitutes the basis for this test.

Procedure

- Remove stomach and duodenum separately by cutting in ligatures.
- Place them both in water. See whether they float or sink.
- If they float, make a small cut while under water to see air-bubbles coming up.

Q23 A drug company is developing a new pregnancy test kit for use on an outpatient basis. The company used the pregnancy test on 100 women who are known to be pregnant out of which 99 showed positive. Out of 100 non-pregnant women on whom this test was tried, 90 showed negative result. What is the sensitivity of this test?

(a) 90% → specificity Total dis = $\frac{100}{99:1}$

(b) 99%

(c) Average of 90 and 99

(d) Can't be calculated from data

$$\frac{99}{100}$$

↓ detects TP out of total diseased

$$\frac{TP}{TP + FN}$$

$$\frac{TN}{TN + FP} = \text{Specificity}$$

37 An elderly woman was brought to the hospital with a history of severe loin pain for the past 7 hours. Ultrasound of the kidney reveals a 2.5 cm renal stone. What is the treatment of choice for this patient?

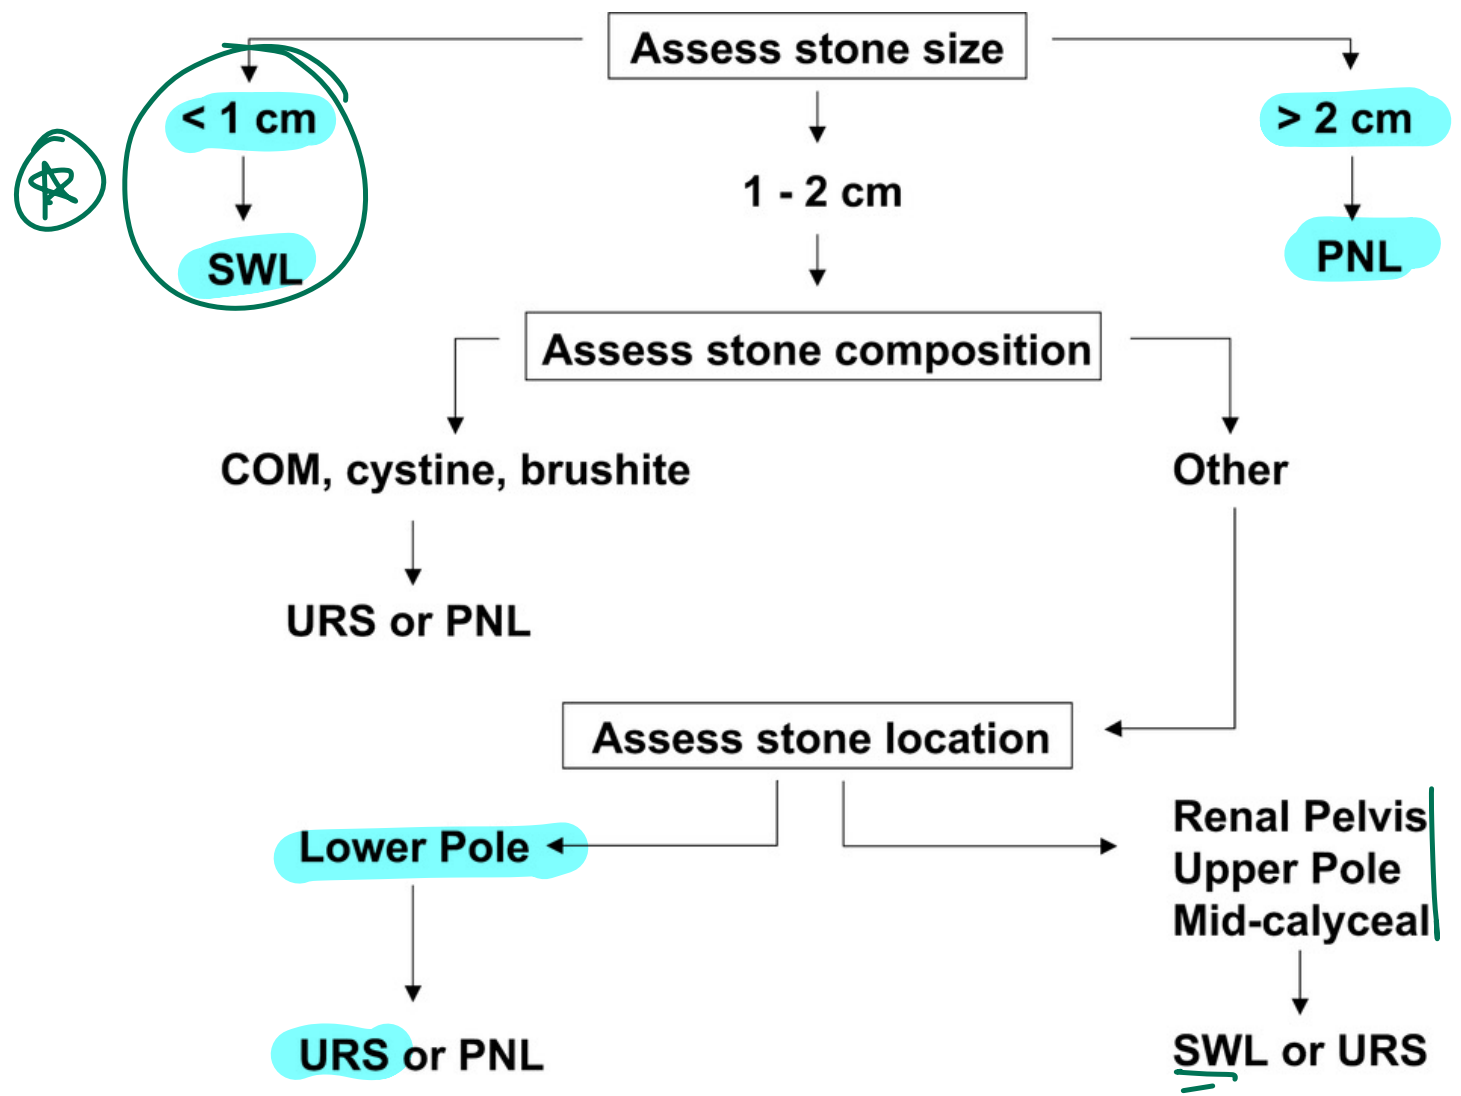

> 2cm - PCNL

(a) Extracorporeal shock-wave lithotripsy → small

✓ (b) Percutaneous nephrolithotomy → 2cm

(c) Ureteroscopic removal → lower pole

(d) Open surgery

38

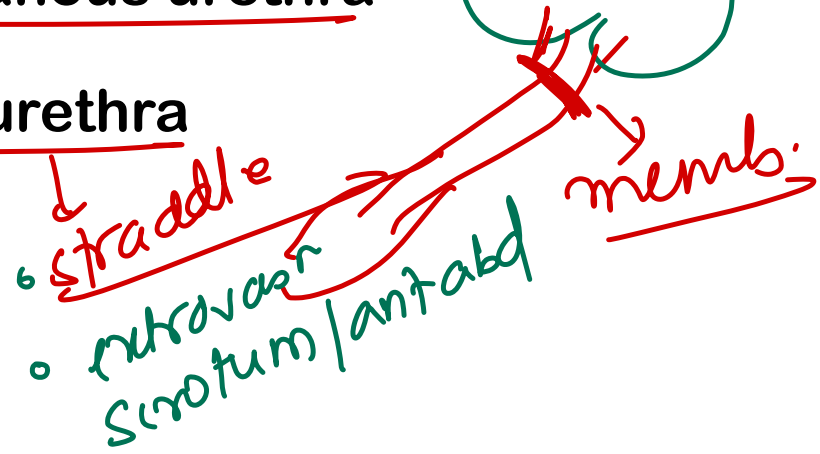

A 21-year-old male patient presented to the hospital after a road traffic accident with a fracture of the pelvis. There was urinary retention and blood at the urethral meatus. On digital rectal examination, he had a high-riding prostate. What is the most probable diagnosis?

vermoeten sign

deep perin pouch

membr

- (a) Rupture of the membranous urethra
- (b) Rupture of the bulbar urethra
- (c) Rupture of bladder
- (d) Rupture of prostatic

Pediatrics

40 A child is below 3rd percentile for height. His growth velocity is normal, and chronological age is more than skeletal age. The most likely diagnosis is

$$\underline{CA > BA} \rightarrow$$

(a) Familial short stature $\rightarrow \underline{CA = BA}$

(b) Primordial dwarfism

~~(c) Constitutional delay in growth~~ - C over

$$\underline{CA > BA}$$

(d) Hypopituitarism

Features	Familial short stature	Constitutional delay in growth
Sex	Both equally affected	More common in boys
Length at birth	Normal	Normal (starts falling < 5th centile in 1st 3 years of life)
Family history	Short stature	Delayed puberty
Parents stature	Short (one or both)	Average
Height velocity	Normal	Normal
Puberty	Normal	Delayed
Bone age (BA) and chronological age (CA)	$BA = CA > \text{height age}$	$CA > BA = \text{height age}$
Final height	Short, but normal for target height	Normal

Q1 Obstetric conjugate is

(a) 8.5 cm
