Category	Definition of Category	Disease	Organism(s)/Agent(s)
A	High-priority agents include organisms that pose a risk to national security because they: Can be easily disseminated or transmitted from person to person Result in high mortality and have the potential for major public health impact Might cause public panic and social disruption Require special action for public health preparedness	<ul style="list-style-type: none"> <li>Anthrax</li> <li>Botulism</li> <li>Plague</li> <li>Smallpox</li> <li>Tularemia</li> <li>Viral hemorrhagic fevers</li> </ul>	<ul style="list-style-type: none"> <li><i>Bacillus anthracis</i></li> <li><i>Clostridium botulinum</i> toxin</li> <li><i>Yersinia pestis</i></li> <li><i>Variola major</i></li> <li><i>Francisella tularensis</i></li> <li>Filoviruses (eg, Ebola, Marburg)</li> <li>Arenaviruses (eg, Lassa, Machupo)</li> </ul>
B	Second highest priority agents include those that: Are moderately easy to disseminate Result in moderate morbidity rates and low mortality Require specific enhancements of laboratory diagnostic capacity and enhanced disease surveillance	<ul style="list-style-type: none"> <li>Brucellosis</li> <li>Epsilon toxin</li> <li>Food safety threats</li> <li>Glanders</li> <li>Melioidosis</li> <li>Psittacosis</li> <li>Q fever</li> <li>Ricin toxin</li> <li>Staphylococcal enterotoxin B</li> <li>Typhus fever</li> <li>Viral encephalitis</li> <li>Water safety threats</li> </ul>	<ul style="list-style-type: none"> <li><i>Brucella</i> species</li> <li><i>Clostridium perfringens</i></li> <li><i>Salmonella</i> species, <i>Shigella</i>, and so forth</li> <li><i>Escherichia coli</i> O157:H7</li> <li><i>Burkholderia mallei</i></li> <li><i>Burkholderia pseudomallei</i></li> <li><i>Chlamydia psittaci</i></li> <li><i>Coxiella burnetii</i></li> <li><i>Ricinus communis</i> (castor beans)</li> <li><i>Staphylococcus aureus</i></li> <li><i>Rickettsia prowazekii</i></li> <li>Alphaviruses (eg, Venezuelan equine encephalitis, eastern equine encephalitis, western equine encephalitis)</li> <li><i>Vibrio cholerae</i>, <i>Cryptosporidium parvum</i> and so forth</li> </ul>
C	Third highest priority agents include emerging pathogens that could be engineered for mass dissemination in the future because of: Availability Ease of production and dissemination Potential for high morbidity and mortality and major health impact	Emerging infectious diseases	<ul style="list-style-type: none"> <li>Nipah virus</li> <li>Hantavirus</li> <li>Tick-borne hemorrhagic fever viruses</li> <li>Tick-borne encephalitis viruses</li> <li>Yellow fever</li> <li>Multidrug-resistant tuberculosis</li> </ul>

Biosafety level	Lab practices	Safety Equipment	Facility
<b>BSL 1</b>	Work on open lab benches or tables. Good microbiological techniques followed	PPE (lab coats, gloves, eye protection) are worn as needed.	Sink for hand washing. Separate doors from the rest of the facility.
<b>BSL 2</b>	Access restricted to the laboratory	Appropriate PPE (lab coats, gloves, eye protection, and face shields). Biological safety cabinets (BSC) to prevent potential aerosols. Autoclave or alternative method for decontamination	Sink and eyewash easily available. Self-closing doors.
<b>BSL 3</b>	Access restricted and controlled at all times. Medical surveillance of laboratory workers.	Appropriate PPE must be worn, and respirators might be required. BSC for all activities.	Hands-free sink and eyewash. Directional airflow from clean areas towards potentially contaminated areas. Entrance to the lab is through 2 self-closing and interlocked doors.
<b>BSL 4</b>	Change clothing before entering and shower upon exiting. Decontaminate all materials before exiting.	BSC and full-body, air-supplied, positive pressure suit. Double-ended autoclave (through the wall).	Laboratory in a separate building or isolated in a restricted zone. Dedicated supply and exhaust air, as well as vacuum lines and decontamination systems.

Disease	Incubation Period
Chickenpox	14-16 days *
Cholera	1-3 days
Diphtheria	2-6 days
Gas gangrene	1-5 days
Gonorrhea	3-5 days *
Hepatitis A	2 weeks-2 months
Hepatitis B	6 weeks-6 months
Hepatitis C	2 weeks-6 months
Herpes simplex	4 days
Influenza	1-3 days
Leprosy	3 months-20+ years
Measles	10-12 days
Meningitis (bacterial)	1-7 days
Mumps	2-3 weeks

**Nocardia vs Actinomyces**

Both are gram ⊕ and form long, branching filaments resembling fungi. ☆

INI

Nocardia → 0

Actinomyces

Aerobe ⊙

Anaerobe ●

☆ Acid fast (weak) A f acids.

Not acid fast B

Found in soil

Normal oral, reproductive, and GI microbiota

Causes pulmonary infections in immunocompromised (can mimic TB but with ⊖ PPD); cutaneous infections after trauma in immunocompetent; can spread to CNS → cerebral abscess

Causes oral/facial abscesses that drain through sinus tracts; often associated with dental caries/extraction and other maxillofacial trauma; forms yellow "sulfur granules"; can also cause PID with IUDs ☆

Moloy both colonies

Treat with sulfonamides (TMP-SMX) ✓

Treat with penicillin ☆☆

Treatment is a SNAP Sulfonamides - Nocardia, Actinomyces - Penicillin

SNAP

↓  
leprosy

• Kinyon / ZN  
• cryptosporidium / T. saginata eggs.

# Listeria monocytogenes

Gram ⊕, facultative intracellular rod; acquired by ingestion of unpasteurized dairy products and cold deli meats, transplacental transmission, by vaginal transmission during birth. Grows well at refrigeration temperatures ("cold enrichment").

Forms "rocket tails" (red in A) via actin polymerization that allow intracellular movement and cell-to-cell spread across cell membranes, thereby avoiding antibody. Listeriolysin generates pores in phagosomes, allowing its escape into cytoplasm. Characteristic tumbling motility in broth.

Can cause amnionitis, septicemia, and spontaneous abortion in pregnant patients; infantile meningitis in immunocompromised patients, neonates, and older adults; mild, self-limited gastroenteritis in healthy individuals.

Treatment: ampicillin.

### Endotoxin

negative sepsis

LPS found in outer membrane of gram  $\ominus$  bacteria (both cocci and rods). Composed of O-antigen + core polysaccharide + lipid A (the toxic component). *Neisseria* have lipooligosaccharide. **LOS: N-O**  
Released upon cell lysis or by living cells by blebs detaching from outer surface membrane (vs exotoxin, which is actively secreted).  
Three main effects: macrophage activation (TLR4/CD14), complement activation, and tissue factor activation.

LPS: 4/14

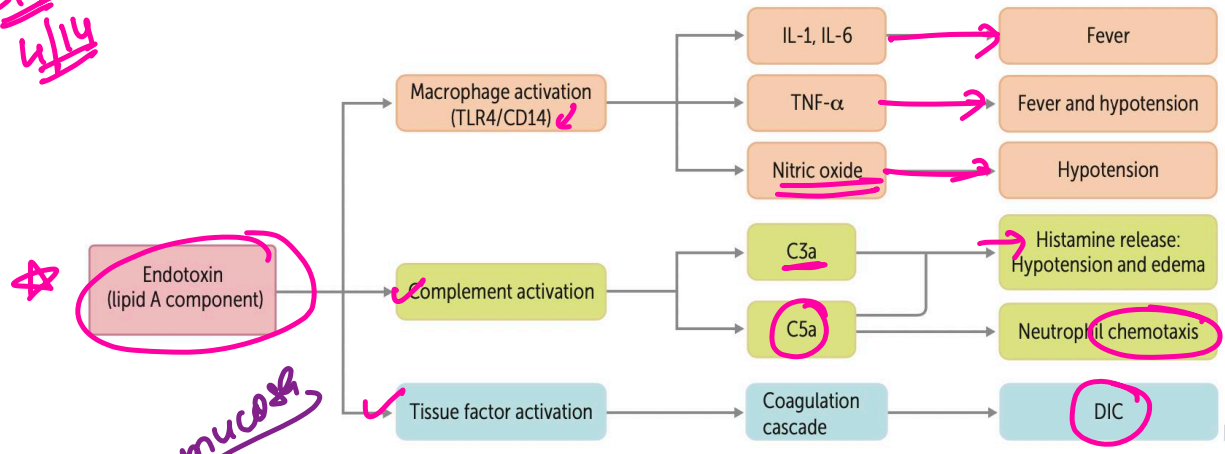

abst in gm +ve

### ENDOTOXINS:

- Edema
- Nitric oxide
- DIC/Death
- Outer membrane
- TNF- $\alpha$
- O-antigen + core polysaccharide + lipid A
- eXtremely heat stable
- IL-1 and IL-6
- Neutrophil chemotaxis
- Shock

pink Neisseria

Endotoxin (lipid A component) mucosa

WFS: n. mening. c shock petechiae

Gram  $\ominus$  diplococci. Metabolize glucose and produce IgA proteases. Contain lipooligosaccharides (LOS) with strong endotoxin activity.

*N gonorrhoeae* is often intracellular (within neutrophils) A.  
Acid production: meningococci - maltose and glucose; gonococci - glucose.

TABLE 26-4

**Virulence factors of *Neisseria meningitidis***

Virulence factors	Biological functions
Capsule	Prevents phagocytosis
<u>LOS</u> endotoxin	Causes damage of the blood vessels associated with meningococcal infections
<u>IgA protease</u>	Destroys <u>IgA immunoglobulin</u> , thereby helps gonococci to attach to the epithelial cells of the upper respiratory tract
<u>Lipooligosaccharides</u>	Stimulates release of TNF- $\alpha$ , which results in host cell damage

*Handwritten notes:*  
 • IgA protease  
 • LOS

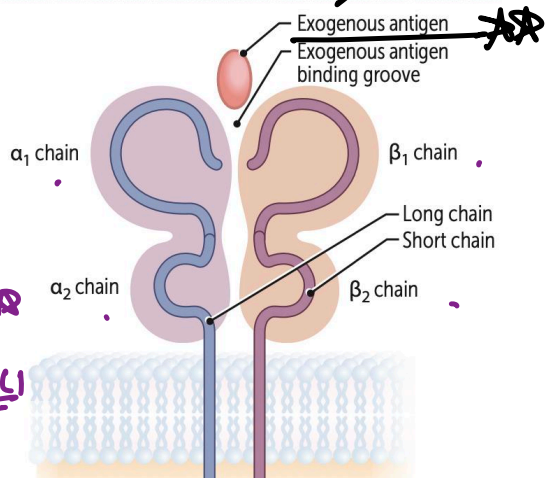

**Major histocompatibility complex I and II**

MHC encoded by HLA genes. Present antigen fragments to T cells and bind T-cell receptors (TCRs).  
*chrom: (6) Q8*

	MHC I	MHC II
LOCI	HLA-A, HLA-B, HLA-C (1)	HLA-DP, HLA-DQ, (HLA-DR) → ⊕ LCH
	MHC I loci have 1 letter	MHC II loci have 2 letters
BINDING	TCR and CD8 x1	TCR and CD4 x2
STRUCTURE	1 long chain, 1 short chain	2 equal-length chains (2 α, 2 β)
EXPRESSION	All nucleated cells, APCs, platelets (except RBCs)	APCs
FUNCTION	Present endogenous antigens (eg, viral or cytosolic proteins) to CD8+ cytotoxic T cells	Present exogenous antigens (eg, bacterial proteins) to CD4+ helper T cells
ANTIGEN LOADING	Antigen peptides loaded onto MHC I in RER after delivery via TAP (transporter associated with antigen processing)	Antigen loaded following release of invariant chain in an acidified endosome
ASSOCIATED PROTEINS	β <sub>2</sub> -microglobulin (AA)	Invariant chain

*\* HLA associates YT*

*1 → IL → α1-3  
 IS → β2 ⊕  
 cell endogenous*

## Superantigens causing shock

Staphylococcus aureus

Toxic shock syndrome toxin (TSST-1)

Cross-links  $\beta$  region of TCR to MHC class II on APCs outside of the antigen binding site

Toxic shock syndrome: fever, rash, shock; other toxins cause scalded skin syndrome (exfoliative toxin) and food poisoning (heat-stable enterotoxin)

Streptococcus pyogenes

Erythrogenic exotoxin A

overwhelming release of IL-1, IL-2, IFN- $\gamma$ , and TNF- $\alpha$   $\rightarrow$  shock

Toxic shock-like syndrome: fever, rash, shock; scarlet fever

no mucosa

in SIS/TEV

• lamolysis

TSST-1 is a superantigen that binds to MHC II and T-cell receptor, resulting in polyclonal T-cell activation and cytokine release.

Staphylococcal toxic shock syndrome (TSS) — fever, vomiting, diarrhea, rash, desquamation, shock, end-organ failure. TSS results in  $\uparrow$  AST,  $\uparrow$  ALT,  $\uparrow$  bilirubin. Associated with prolonged use of vaginal tampons or nasal packing.

Compare with Streptococcus pyogenes TSS (a toxic shock-like syndrome associated with painful skin infection).

- = Presented peptide recognized by TCR
- = Superantigen binding non-specifically to MHC and recognized by TCR

DF/DHF	Grade	Symptoms	Laboratory
DF*		Fever with two or more of the following signs: headache, retro-orbital pain, myalgia, arthralgia plus positive tourniquet test	Leucopenia occasionally Thrombocytopenia, may be present, no evidence of plasma loss
DHF	I	Above signs plus <u>positive tourniquet test</u> (1)	Thrombocytopenia $\leq 100,000/\mu\text{L}$ , hematocrit rise $\geq 20\%$ (2)
DHF	II	Above signs plus <u>spontaneous bleeding</u> (2)	Thrombocytopenia $\leq 100,000/\mu\text{L}$ , hematocrit rise $\geq 20\%$
DHF	III**	Above signs plus <u>circulatory failure</u> (weak pulse, hypotension, restlessness) (3)	Thrombocytopenia $\leq 100,000/\mu\text{L}$ , hematocrit rise $\geq 20\%$
DHF	IV**	<u>Profound shock</u> with undetectable blood pressure and pulse (4)	Thrombocytopenia $\leq 100,000/\mu\text{L}$ , hematocrit rise $\geq 20\%$

→ pit < 1/L  
HCT ↑ 20%.

DF: dengue fever; DHF: dengue hemorrhagic fever; \*Modified WHO criteria; \*\*DHF Grade III and IV are also called as dengue shock syndrome (DSS).

Fever (Acute onset of 2-7 days)	
Haemorrhagic manifestations	Evidenced by <u>positive tourniquet test</u> , petechiae, ecchymoses or purpura, or bleeding from mucosa, gastrointestinal tract, injection sites, or other locations. (1)
Thrombocytopenia	Platelet count of $\leq 100,000$ cells/mm <sup>3</sup> (2)
<b>Dengue Shock Syndrome (DSS)</b>	
Criteria for DHS (As above) and signs of shock (3)	Tachycardia, cool extremities, delayed capillary refill, weak pulse, lethargy or restlessness (a sign of reduced brain perfusion). (4)
	Pulse pressure $\leq 20$ mmHg with increased diastolic pressure, e.g. 100/80 mmHg. (5)
	Hypotension by age, defined as systolic pressure $< 80$ mmHg for those aged $< 5$ years or 80 to 90 mmHg for older children and adults. (6)

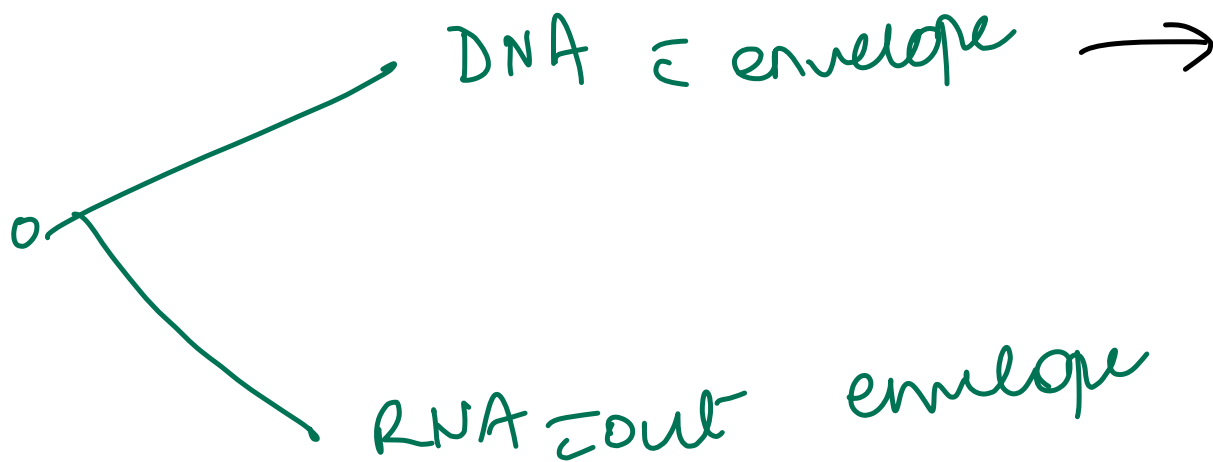

The first two clinical criteria, plus thrombocytopenia and haemoconcentration or a rising haematocrit, are sufficient to establish a clinical diagnosis of DHF. The presence of liver enlargement in addition to the first two clinical criteria is suggestive of DHF before the onset of plasma leakage. In cases with shock, a high haematocrit and marked thrombocytopenia support the diagnosis of DSS. A low ESR ( $< 10$  mm/hour) during shock differentiates DSS from septic shock. (6).

(virology class)

Type of symmetry	Examples
Naked icosahedral	Poliovirus (picorna) Adenovirus Hepatitis A virus
Naked helical	Tobacco mosaic virus

Fostemsavir is a first-in-class HIV attachment inhibitor that works by attaching directly to HIV gp120 and, as a result, blocking HIV from attaching to CD4 on the host cell.

Two inhibitors interfering with the entry process have been approved for clinical use. Maraviroc prevents the interaction of gp120 with the co-receptor CCR5, and T20 (enfuvirtide) binds to HR1 in gp41 and prevents the formation of the six-helix bundle (9,-11).

**Hepatitis C therapy**

Chronic HCV infection treated with multidrug therapy that targets specific steps within HCV replication cycle (HCV-encoded proteins). Examples of drugs are provided.

DRUG	MECHANISM	TOXICITY
<b>NS5A inhibitors</b>		
Elbasvir	Inhibits NS5A, a viral phosphoprotein that plays a key role in RNA replication	Headache, diarrhea
Ledipasvir	Exact mechanism unknown	
Pibrentasvir		
Velpatasvir		
<b>NS5B inhibitors</b>		
Sofosbuvir	Inhibits NS5B, an RNA-dependent RNA polymerase acting as a chain terminator. Prevents viral RNA replication.	Fatigue, headache
<b>NS3/4A inhibitors</b>		
Glecaprevir	Inhibits NS3/4A, a viral protease, preventing viral replication.	Headache, fatigue
Grazoprevir		
<b>Alternative drugs</b>		
Ribavirin	Inhibits synthesis of guanine nucleotides by competitively inhibiting IMP dehydrogenase.	Hemolytic anemia, severe teratogen

Parvovirus B19 is transmitted between humans by aerosol inhalation. The main target cells of parvovirus B19 are erythroid progenitor cells in bone marrow. It is not known whether the virus initially replicates in the respiratory tract before dissemination to the bone marrow or if the virus is able to cross the lung mucosa and then migrate to the bone marrow. To infect target cells, parvovirus B19 requires a primary receptor Gb4Cer (globoside) as well as co-receptors Ku80 autoantigen and α5β1 integrin that mediate attachment and internalisation by endocytosis. The Gb4Cer receptor is found on the surface of erythrocytes, platelets and granulocytes and potentially plays a role in transference of bound virus to other tissues. The Gb4Cer receptor is also expressed in lung, heart, liver, kidney, synovium, endothelium and gut tissue where parvovirus B19 DNA can often be detected. This may be involved in autoimmune reactions and viral persistence.

Balantidium coli 4DPDx

2 The cyst is the infectious stage and is acquired by the host through ingestion of contaminated food or water.

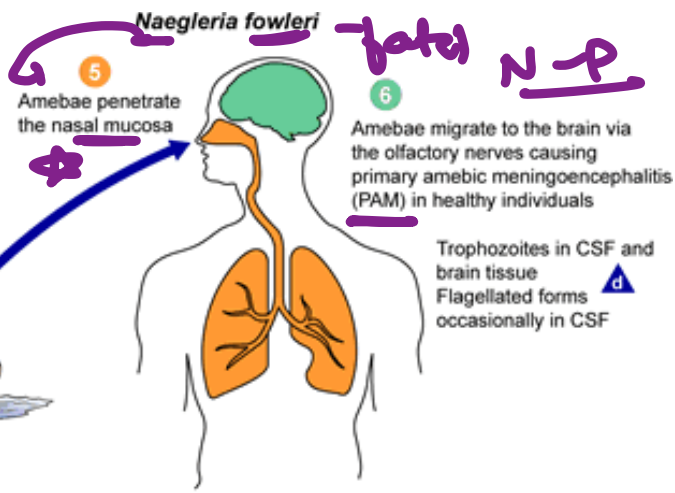

Some trophozoites invade the wall of the colon.

Infective stage Diagnostic stage

1 Cysts shed in formed stools; Both cysts and trophozoites may be shed in diarrheal stools.

cilia Bal. Balantidium coli

Naegleria fowleri fatal N-P

5 Amebae penetrate the nasal mucosa

6 Amebae migrate to the brain via the olfactory nerves causing primary amebic meningoencephalitis (PAM) in healthy individuals

Trophozoites in CSF and brain tissue Flagellated forms occasionally in CSF

Nag PAM. fatal

Water-related activities such as swimming, soaking in hot springs, or using contaminated hot tap water can result in water going up the nose.
